Problem Solving with Computers-II

Announcements

- Pa02 assigned next week!
 - Its about implementing a BST with a movie data set, collecting and analyzing running time!
 - Part of the assignment involves writing a report, and explaining the trends in your data
 - Due at the end of the quarter
 - Don't wait until the last minute!
- Remember to turn in any regrade requests for the midterm by next Monday

Finding the Maximum of Two Integers

 Here's a small function that you might write to find the maximum of two integers.

```
int maximum(int a, int b)
{
   if (a > b)
     return a;
   else
     return b;
}
```

One Hundred Million Functions...

Suppose your program uses 100,000,000 different data types, and you need a maximum function for each...

```
int maximum(int a, int b)
                                                                                                                                                    int maximum(Hoo a, Hoo b)
                                                                                                                                                                                                 int maximum(Doo a, Doo b)
                                                                                                                                                       if (a > b)
                                                                                              int maximum(Hoo a, Hoo b)
                                                                                                                                                                                                                                                       int maximum(Doo a, Doo b)
                                                                                                                                                                                                                                             um()
                                                                                                                                                                                                   if (a > b)
                                                                                                                                          int maximum(Doo a, Doo b)
                                                                                                if (a > b)
                                                                                                                                                                                                                                                          if (a > b)
                                                                         int maximum(Noo a,
                                                                                                                                                                                      m a;
         if (a > b)
                                                                                                                                                                                                                                                            return a:

                                                                                                                                                                                                                                                      return b:
                                                                             return b:
                                                                                                      int maximum(Ioo a, Ioo b)
                                                                                                                                        return b;
                                                                                                        if (a > b)
                                                                                                                                                                      maximum(Coo a, Coo b)
                                                                                                                                                                                                                           int maximum(Coo a, Coo b)
                                                                            return b:
                                                                                                                                                                      if (a > b)
                                                                                                                                                                                                        a, Goo b)
                                                                                                             int maximum(Coo a, Coo b)
                                                                                                                                                                                                                             if (a > b)
                                                                                                                                                                        return a:
                                                                                                                                                                                                                                                               o a. Goo b)
                                                                                                                                                                                                                               return a:
                                                                                                                if (a > b)
                                                                                                                                                 o a, Goo b)
                                                                                      int maximum(
                                                                                                                                                                        return b:
                                                                                                                                                                                                                               return b;
                                                                                        if (a > b)
                                                                                                                  return b:
                                                                                          return a:
                                                                                          return b:
```

A Template Function for Maximum

When you write a template function, you choose a data type for the function to depend upon...

```
template <class Item>
Item maximum(Item a, Item b)
{
   if (a > b)
     return a;
   else
     return b;
}
```

```
BST, without templates:
class BSTNode {
public:
  BSTNode* left;
  BSTNode* right;
  BSTNode* parent;
  int const data;
  BSTNode (const int& d):
     data(d) {
    left = right
         = parent = nullptr;
```

BST, with templates:

```
template<class Data>
class BSTNode {
public:
  BSTNode<Data>* left;
  BSTNode<Data>* right;
  BSTNode<Data>* parent;
  Data const data;
  BSTNode (const Data & d):
     data(d) {
    left = right
         = parent = nullptr;
};
```

```
BST, with templates:
                                How would you create a BSTNode object on
                                the runtime stack?
template<class Data>
class BSTNode {
                                  A. BSTNode n(10);
public:
                                  B. BSTNode<int> n;
  BSTNode<Data>* left;
                                  C.BSTNode<int> n(10);
  BSTNode<Data>* right;
                                  D. BSTNode<int> n = new BSTNode<int>(10);
  BSTNode<Data>* parent;
                                  E. More than one of these will work
  Data const data;
  BSTNode (const Data & d):
     data(d) {
    left = right = parent = nullptr ;
```

```
BST, with templates:
template<class Data>
class BSTNode {
public:
  BSTNode<Data>* left;
  BSTNode<Data>* right;
  BSTNode<Data>* parent;
  Data const data;
  BSTNode (const Data & d):
     data(d) {
    left = right = parent = nullptr ;
```

How would you create a **pointer** to BSTNode with integer data?

```
A. BSTNode* nodePtr;
B. BSTNode<int> nodePtr;
C.BSTNode<int>* nodePtr;
```

```
BST, with templates:
```

```
template<class Data>
class BSTNode {
public:
  BSTNode<Data>* left;
  BSTNode<Data>* right;
  BSTNode<Data>* parent;
  Data const data;
  BSTNode (const Data & d):
     data(d) {
    left = right = parent = nullptr ;
```

Complete the line of code to create a new BSTNode object with int data on the heap and assign nodePtr to point to it.

BSTNode<int>* nodePtr

Working with a BST

```
template<typename Data>
class BST {
private:
 BSTNode<Data>* root; //Pointer to the root of this BST
public:
  /** Default constructor. Initialize an empty BST. */
 BST() : root(nullptr){ }
 void insertAsLeftChild(BSTNode<Data>* parent, const Data& item) {
     // Your code here
```

Working with a BST: Insert

```
//Assume this is inside the definition of the class
void insertAsLeftChild(BSTNode<Data>* parent, const Data& item)
  {
      // Your code here
}
```

Which line of code correctly inserts the data item into the BST as the left child of the parent parameter.

```
A.parent.left = item;
B.parent->left = item;
C.parent->left = BSTNode(item);
D parent->left = new BSTNode<Data>(item);
E.parent->left = new Data(item);
```

Working with a BST: Insert

```
void insertAsLeftChild(BSTNode<Data>* parent, const Data& item) {
   parent->left = new BSTNode<Data>(item);
}
```

Is this function complete? (i.e. does it do everything it needs to correctly insert the node?)

A. Yes. The function correctly inserts the data B. No. There is something missing.

What is difference between templates and typedefs?

```
template <class Item>
Item maximum(Item a, Item b)
{
   if (a > b)
      return a;
   else
      return b;
}
```

```
typedef int item;
item maximum(item a, item b)
{
   if (a > b)
     return a;
   else
     return b;
}
```

Template classes: Non-member functions

```
BST operator+(const BST& b1, const BST&b2);

template <class T>
BST<T> operator+(const BST<T>& b1, const BST<T>&b2);
```

Template classes: Member function definition

For the compiler a name used in a template declaration or definition and that is dependent on a template-parameter is assumed not to name a type *unless* it's preceded by the typename keyword

```
template<class T>
class BST{
    //Other code
    Node* getNodeFor(T value, Node* n) const;
};
```

Template classes: Including the implementation

```
//In bst.h
class BST{
//code
};
#include "bst.cpp" (or #include "bst.template")
```

How to Convert a Container Class to a Template

- 1. The template prefix precedes each function prototype or implementation.
- 2. Outside the class definition, place the word <Item> with the class name, such as bag<Item>.
- Use the name Item instead of value_type.
- 4. Outside of member functions and the class definition itself, add the keyword typename before any use of one of the class's type names. For example:

```
typename bag<Item>::size_type
```

- 5. The implementation file name now ends with .template (instead of .cxx), and it is included in the header by an include directive.
- 6. Eliminate any using directives in the implementation file. Therefore, we must then write std:: in front of any Standard Library function such as std::copy.
- 7. Some compilers require any default argument to be in both the prototype and the function implementation.

 Review and demo
